Introduction

The DM5160 is a 1-channel video decoder designed for cameras with Sony's new 960H CCD sensor. The DM5160 converts 9/6.5 MHz analog CVBS signals to digital 36/27 MHz CCIR656 signals. The DM5160 integrates an internal PLL, and decodes both 960H and 720H videos using the same (27MHz) external clock source.

Features

Video Decoder

- Accepts NTSC (M,J), PAL (B, D, G, H, I, M, Nc) and SONY 960H CCD Camera
- Video decoder could be programmed to operate at 27 or 36MHz.
- 10-bits video ADCs with built in 9/6.5 MHz analog low pass filter
- Automatic gain control for Luminance and Chrominance
- Programmable brightness, contrast, saturation, hue, and sharpness
- Support video interface YCbCr 4:2:2, 4:1:1, 4:2:0 format
- Support mirror function
- 5-H comb filter for YC separation
- Chrominance line filter for PAL phase error
- DLL for video synchronization, supports 27MHz crystal within +/-1000 ppm variance
- Advanced video synchronization for weak and noisy CVBS. Supports video signal transmitted by 500-meter long cable
- Support line lock camera

Miscellaneous

- Use a single external 27MHz crystal to support both 960H and 720H video
- One programmable PLL integrated
- Slave I2C bus
- Ultra low power consumption. Under 150mW for normal operation. Under 50mW for suspend mode.
- 32-pin LQFP (5mmx5mm) package
- 1.8V core power, 3.3V analog power and 1.8V analog power

Applications

Suggested applications include

- DVR
- Car DVR
- Video capture card

Terminal Assignment

Terminal Functions

Pin Name	Pin number	Type	Description
Analog Video Signals			
AIP1A	1	A	Analog input A.
AIP1B	2	A	Analog input B. (analog chroma input)
AGND	7	G	Analog ground. (used as signal input reference)

Pin Name	Pin number	Type	Description
Clock Signals			
XTAL1	5	I	Clock input. A 27 MHz fundamental crystal or a single-ended oscillator can be connected
XTAL2	6	O	Clock output. For connecting a crystal

Pin Name	Pin number	Type	Description
Host Interface			
SCL	21	I	The I2C serial interface Clock line.
SDA	22	I/O	The I2C serial interface Data line.

Pin Name	Pin number	Type	Description
General Signals			
RESETB	8	I	Reset input. Low active
PDN	28	I	Power down control pin. # is high active
INTREQ	27	O	Interrupt output signal

Pin Name	Pin number	Type	Description
Video Output Signals			
VSYNC	24	O	Vertical Sync and multi-purpose output. See register for control information.

HSYNC	25	O	Horizontal Sync and multi-purpose output. See register for control information.
FID(MPOUT)	23	O	Multi-purpose output pin See register for control information.
AVID	26	O	Active video indicator.
PCLK	9	O	Data output clk.
Y7/I2CSEL	11	O	Digital Video data output of 4:2:2 YCbCr[7]. I2CSEL: The i2c interface address select pin 0
Y6,Y5,Y4,Y3, Y2,Y1,Y0	12,13,14,15, 16,17,18	O	Digital Video data output of 4:2:2 YCbCr[6:0].

Pin Name	Pin number	Type	Description
Power and Ground Pins			
CH_AGND	31	G	Analog ground.
CH_AVDD	32	P	1.8V analog supply ADC.
PLL_AVDD	4	P	1.8V analog supply PLL
PLL_AGND	3	G	Analog ground PLL
IO_DVDD	10	P	3.3V digital I/O power
DGND	19	G	Digital ground
DVDD	20	P	1.8V digital core power
REFP	29	NC	Non Connected
REFM	30	NC	Non Connected

Block Diagram

Introduction

The DM5160 video decoder contains two Video ADCs, a Video Synchronization block, an AGC block, an YC separation block, a UV Demodulation block, a Luma/Chroma Processor block, a Mirror Function block, and a BT 656 output block.

In addition to CVBS, the DM5160 video decoder supports S-Video as well.

Video Synchronization

Video Synchronization performs video detection function. It automatically detects NTSC(M), NTSC(443), PAL(B,D,G,H,I), PAL(M), PAL(N), PAL(60). A smart video detection algorithm has been adopted. Therefore the DM5160 can perform fast and stable video synchronization even if the input signal is weak or the external crystal is with error as large as +/- 1000 ppm.

Automatic Gain Control

Automatic Gain Control (AGC) block performs both Luma AGC and Chroma AGC (CGAC). After video synchronization, Luma AGC adjusts input Luma level to the standard level (1Vpp). A further CAGC is performed after Luma AGC for signal with different Luma and Chroma attenuation.

Y/C Separation

Y/C Separation is for CVBS input only. After this block CVBS signal is separated into Luma and Chroma components. A 5-H 2D comb filter is adapted in the Y/C separation block.

UV demodulation

After Y/C separation, the UV demodulation block performs UV demodulation to the Chroma component. The phase and frequency of the UV demodulation is from a color burst subcarrier tracking block for both NTSC and PAL mode. A UV demodulation LPF is also adopted to filter out chroma noise.

Luma/Chroma Processor

This block contains a programmable Luma sharpness filter. Hue, Saturation, Brightness and Contrast adjustment are also supported. The adjusted video is then transformed from YUV to YCbCr domain for CCIR656 output interface.

Mirror Function

The DM5160 also supports mirroring function. When mirroring function is performed, the samples at each line are horizontally left-right flipped. The following figure illustrates the result of horizontal mirroring.

Video Interface

The DM5160 video decoder supports 27MHz BT.656 (for 720H) and 36MHz BT.656-like (for 960H) video output format with BT.601 synchronization signals. A horizontal cropping function also included in this block.

Video Interface

The DM5160 outputs 27MHz CCIR656 with 720x480/720x576 resolution (conventional 720H), or outputs 36MHz CCIR656-like format (BT.1302) with 960x480/960x576 resolution (Sony 960H).

For these video outputs, SAV (Start of Active Video) and EAV (End of Active Video) are inserted to indicate active video interval. Each channel uses one output port to transmit video data, that is, luminance and chrominance data are transmitted through the same port. The output timing diagram is shown below.

YCbCr 4:2:2

The number of data cycles in active horizontal line will vary according to the output YCbCr 4:2:2 format. For 720H video outputs, the active horizontal line contains 1440 cycles. For 960 H video outputs, the active horizontal line contains 1920 cycles.

The DM5160 also supports the 4:2:0 and 4:1:1 format. The output timing diagram is shown below.

YCbCr 4:2:0

Odd Line:

Even Line:

The number of data cycles in active horizontal line will vary according to the output YCbCr 4:2:0 format. For 720H video outputs, the active horizontal line contains 1080 cycles. For 960 H video outputs, the active horizontal line contains 1440 cycles.

YCbCr 4:1:1

The number of data cycles in active horizontal line will vary according to the output YCbCr 4:1:1 format. For 720H video outputs, the active horizontal line contains 1080 cycles. For 960 H video outputs, the active horizontal line contains 1440 cycles.

SAV and EAV indicate the active video interval. The values of the first three bytes in SAV and EAV are invariant preamble: 0xFF, 0x00, and 0x00. Different values are designated to the last byte according to different conditions: Field, V time, and H time. The MSB of this byte is always set to 1 and it's followed by three bits to represent the condition of F, V, and H respectively. The last four bits are used as protection bits. The detailed code sequences of SAV and EAV are illustrated in the following table.

Condition			FVH Value			SAV/EAV Code Sequence			
Field	V time	H time	F	V	H	Byte 0	Byte 1	Byte 2	Byte 3
Odd	Active	SAV	0	0	0	0xFF	0x00	0x00	0x80
Odd	Active	EAV	0	0	1	0xFF	0x00	0x00	0x9D
Odd	Blank	SAV	0	1	0	0xFF	0x00	0x00	0xAB
Odd	Blank	EAV	0	1	1	0xFF	0x00	0x00	0xB6
Even	Active	SAV	1	0	0	0xFF	0x00	0x00	0xC7
Even	Active	EAV	1	0	1	0xFF	0x00	0x00	0xDA
Even	Blank	SAV	1	1	0	0xFF	0x00	0x00	0xEC
Even	Blank	EAV	1	1	1	0xFF	0x00	0x00	0xF1

BT601 Synchronization Signals

External syncs are provided via the following signals

- VSYNC (vertical sync signal)
- HSYNC (horizontal sync signal)
- FID (field indicator)
- AVID (active video indicator)

VSYNC, HSYNC and FID are programmed to be the external syncs for BT.601. And the AVID indicates the valid region of video active region. The default settings for a 525/625 line video output are given as an example below.

PLL

The DM5160 has an internal PLL to generate the system and pixel clocks. A 27MHz or 36 MHz is required for the PLL.

The default PLL setting is shown in the following table.

	Crystal In clock (MHz)	PLL out (MHz)	Function
PLL1	27	54	System/pixel clock

PLL default operated clock

The PLL parameters for various system configurations are shown in the following table.

	Crystal(MHz)	PLL out(MHz)	M	N	OD
PLL1	27	72	62	4	2
	27	54	14	0	2
	36	72	14	0	2
	36	54	10	0	2

Formula:

$$\text{CLK_OUT} = \text{XIN} * (\text{M}+2) / [(\text{N}+2) * \text{OD} * 2]$$

Where CLK_OUT: PLL output frequency

XIN: PLL input frequency.

M: The numerator of PLL formula.

[N, OD]: The denominator of PLL formula.

Attention:

1. 100MHz <= CLK_OUT * OD <= 250MHz
2. 1MHz <= XIN/(N+2) <= 25MHz
3. OD >= 1

Truth Table:

PD	BP	OE	CLK_OUT
0	0	0	CLK_OUT
0	0	0	XIN
Don't Care	1	0	XIN
Don't Care	Don't Care	1	0
Other			Undefined

PD: Power down control; Active high.

BP: Bypass XIN to CLK_OUT; Active high.

OE: CLK_OUT enable pin, Active low.

Host Interface

In the DM5160, I²C is used for setting configuration and parameters, for example, brightness, contrast, saturation, hue, and sharpness control. The typical timing diagram of I²C write and read access is illustrated in the following figure.

Write operation of I²C bus

Read operation of I²C bus

Write/Read Address							
Slave Address							R/W
1	0	1	1	1	0	I2CSEL	0: Write; 1: Read

The external Pull-up/Pull-down resistor connected to the pin “Y7/I2CSEL” indicates the device address I2CSEL. When pull-up resistor is connected to the pin, it indicates I2CSEL with a high value. Otherwise when pull-down resistor is connected to the pin, it indicates I2CSEL with a low value.

	Write Address	Read Address
I2CSEL = 0	B8	B9
I2CSEL = 1	BA	BB

	MSK_LINE_F1				MSK_LINE_F0		

MSK_LINE_F0: When REG36[0] = 1, Mask Field 0 last number of active lines (0-7)

MSK_LINE_F1: When REG36[0] = 1, Mask Field 1 last number of active lines (0-7)

Address= 8'h38

MONO TH								
7-bit	6-bit	5-bit	4-bit	3-bit	2-bit	1-bit	0-bit	
1	0	0	5'h1f					
MONO_EN			MONO_TH					

MONO_TH: MONO mode AGC threshold. AGC max value 30. when set MONO_TH 31.

AGC will always less than MONO_TH.

MONO_EN: Set 0, when no valid color burst detected.

Output CCIR656 Y through Notch filter.

Set 1, when no valid color burst detected. Output CCIR656

 Y through Notch filter if $AGC_GAIN \geq MONO_TH$, otherwise output CCIR656 Y with ADC data.

When No valid color burst detected (color kill mode). Output CCIR656 Cb/Cr with 128 (no color).

Address= 8'h39

COLOR BURST DETECT							
7-bit	6-bit	5-bit	4-bit	3-bit	2-bit	1-bit	0-bit
1	3'h4			4'h5			
CAGCT RACKE N	COLBSTCYC			COLBSTHSEL			

COLBSTHSEL: Color Burst detection threshold.

 $4'h0 : COLBSTH = 0.125 * (BLANK\ TIP - SYNC\ TIP)$
 $4'h1 : COLBSTH = 0.25 * (BLANK\ TIP - SYNC\ TIP)$
 $4'h2 : COLBSTH = 0.375 * (BLANK\ TIP - SYNC\ TIP)$
 $4'h3 : COLBSTH = 0.5 * (BLANK\ TIP - SYNC\ TIP)$

4'h4:COLBSTH = 0.09375*(BLANK TIP – SYNC TIP)

4'h5:COLBSTH = 0.078125*(BLANK TIP – SYNC TIP)

4'h6:COLBSTH = 0.0625*(BLANK TIP – SYNC TIP)

4'h7:COLBSTH = 0.03125*(BLANK TIP – SYNC TIP)

4'h8:COLBSTH = 0

When color burst peak to peak value larger than

COLBSTHSEL, it's been considered a good color burst signal cycle

COLBSTCYC: When COLBSTCYC numbers of valid color burst cycle detected, VD will decode video with color and Color AGC will optionally started. Otherwise will enter color kill mode

CAGCTRACKEN: CAGC Track enable. Set 0 to disable CAGC track

Address= 8'h3A

CAGC							
7-bit	6-bit	5-bit	4-bit	3-bit	2-bit	1-bit	0-bit
1	0	0	0	0	1	0	0
CAGCEN	CAGCLOCKOPT	cagc_gain					

cagc_gain: RO. Chroma gain value. [5:2] integer, [1:0] fractional. (max 15.75, min 1)

CAGCLOCKOPT: Set 1, enable color AGC tracking until CAGC gain stable.

Set 0, color AGC tracking for first 15 video decoded frames.

CAGCEN : Set 1, enable color AGC.

Address= 8'h3B

Line Lock Camera								
7-bit	6-bit	5-bit	4-bit	3-bit	2-bit	1-bit	0-bit	
1	0	0	0	0	0	0	0	
CAMLOCKOPT	LOCKCAM_DET	HLOCKDET1	ACTSHIFT					

ACTSHIFT: Active region shift, 2's compliment (-16~15)

HLOCKDET1: Set 1, to enable auto-detect Line Lock camera.

LOCKCAM_DET: RO, Line lock camera detected. (RO)

CAMLOCKOPT: Set 1, when line lock camera used.

Address= 8'h3C

LLOCKTH							
7-bit	6-bit	5-bit	4-bit	3-bit	2-bit	1-bit	0-bit
8'h20							
LLOCKTH							

LLOCKTH: Line Lock auto detection threshold, valid only when 0x3B[5]=1.

When REG13[1]=1, line boundary difference within a field larger than LLOCKTH, Line Lock Camera detected.

Note: when clock offset tracking unstable and REG13[1]=1, line boundary difference might be large within a field.

Address= 8'h3D

VD_CFG							
7-bit	6-bit	5-bit	4-bit	3-bit	2-bit	1-bit	0-bit
0	1	0	0	0	0	0	0
	ORSTOPT	OBFOVF	OBFUDF	LLFAR4FSOPT1			LLFAR4FSOPT

LLFAR4FSOPT: Set 1, decode video chroma without clock offset compensation.

Set 0, decode video chroma after clock offset compensation.

Set this bit to one for Line Lock Camera.

LLFAR4FSOPT1: Set 1, Auto adjust the active region related to clock offset.

When force line lock mode, set this bit to 1;

OBFUDF: RO. CCIR output buffer under flow.

OBFOVF: RO. CCIR output buffer over flow.

ORSTOPT: Set 1, Reset CCIR output buffer when output buffer overflow or underflow.

Address= 8'h3E

DROP FRAME							
7-bit	6-bit	5-bit	4-bit	3-bit	2-bit	1-bit	0-bit
0	0	0	0	0	0	0	0
FRDROP							FRDRO PEN

FRDRO PEN: Frame drop enable. Set 1 to enable drop frame function.

FRDROP: Drop frame number:

$$\text{Output Frame Rate} = (1 - 1/\text{FRDROP}) * \text{Frame_Rate} \text{ when } \text{FRDROP} > 0.$$

NTSC mode Frame_Rate = 30 frame/sec

PAL mode Frame_Rate = 25 frame/sec

Ex. FREROPEN=1, FRDROP=2, NTSC mode;

Output Frame Rate = (1-1/2)*30 frame/sec = 15 frame/sec

Address= 8'h3F

OUT BUFFER							
7-bit	6-bit	5-bit	4-bit	3-bit	2-bit	1-bit	0-bit
8'h1a							
OBFTH							

OBFTH: CCIR656 output buffer ready threshold.

Once CCIR656 output buffer count is larger than

OBFTH, starts output CCIR656 active region.

PS. CCIR656 output buffer max length is 48, set OBFTH around middle level of buffer length.

Address= 8'h40

REVISION_ID: RO, The DM5160 CHIP version ID.

PLL

Formula:

$$\text{CLK_OUT} = \text{XIN} * (\text{M}+2) / [(\text{N}+2) * \text{OD} * 2]$$

Where CLK_OUT: PLL output frequency

XIN: PLL input frequency.

M: The numerator of PLL formula.

[N, OD]: The denominator of PLL formula.

Attention:

1. 100MHz <= CLK_OUT * OD <= 250MHz
2. 1MHz <= XIN/(N+2) <= 25MHz
3. OD >= 1

Truth Table:

PD	BP	OE	CLK_OUT
0	0	0	CLK_OUT
0	0	0	XIN
Don't Care	1	0	XIN
Don't Care	Don't Care	1	0
Other			Undefined

PD: Power down control; Active high.

BP: Bypass XIN to CLK_OUT; Active high.

OE: CLK_OUT enable pin, Active low.

DV _{DD} to DGND	-0.5V to 2.5V
PLL_AV _{DD} to PLL_AGND	-0.5V to 2.5V
CH1_AV _{DD} to CH1_AGND	-0.5V to 2.5V

Digital input voltage range, V _I to DGND	-0.5V to 4.6V
Input voltage range, XTAL1 to PLL_GND	-0.5V to 2.5V
Analog input voltage range A _I to CH1_AGND	-0.2V to 2.0V
Digital Output voltage range, V _O to DGND	-0.5V to 4.6V
Storage Temperature Range, T _{stg}	-65°C to 150°C

Recommended Operating Conditions

		MIN	TYP	MAX	UNIT
IODV _{DD}	Digital I/O supply voltage	2.97	3.3	3.63	V
DV _{DD}	Digital supply voltage	1.62	1.8	1.98	V
PLL_AV _{DD}	Analog PLL supply voltage	1.62	1.8	1.98	V
CH1_AV _{DD}	Analog core supply voltage	1.7	1.8	1.9	V
V _{I(P-P)}	Analog input voltage (ac-coupling necessary)	0.25		1.0	V
V _{IH}	Digital input voltage high	2		5	V
V _{IL}	Digital input voltage low	-0.3		0.8	V
V _{IH_XTAL}	XTAL input voltage high	0.7 PLL_AV _{DD}			V
V _{IL_XTAL}	XTAL input voltage low			0.3 PLL_AV _{DD}	V
I _{OH}	High-level output current			2	mA
I _{OL}	Low-level output current			-2	mA
I _{OH_SCLK}	SCLK high-level output current			4	mA
I _{OL_SCLK}	SCLK low-level output current			-4	mA
T _A	Operating free-air temperature	-40		85	°C

Crystal Specifications

CRYSTAL SPECIFICATIONS	MIN	NOM	MAX	UNIT
Frequency		27.0/36.0		MHz
Frequency tolerance		±100		ppm

Electrical Characteristics

$V_{DD} = 1.8\text{ V}$, $PLL_AV_{DD} = 1.8\text{ V}$, $CH1_AV_{DD} = 1.8\text{ V}$, $IOV_{DD} = 3.3\text{ V}$

For minimum/maximum values: $T_A = -40^\circ\text{C}$ to 85°C , and for typical values: $T_A = 25^\circ\text{C}$ unless otherwise noted

DC Electrical Characteristics

PARAMETER	TEST CONDITIONS (see NOTE 1)	MIN	TYP	MAX	UNIT
$I_{DD(I/O_D)}$ Digital I/O supply current	Color bar input		25.5		mA
$I_{DD(D)}$ Digital core supply current	Color bar input		119.1		mA
$I_{DD(A)}$ Analog supply current	Color bar input		47		mA
P_{TOT} Total power dissipation, normal mode	Color bar input		375.7	386.6	mW
P_{DOWN} Total power dissipation, power-down mode	Color bar input			17.8	mW
C_i Input capacitance	By design		8		pF
V_{OH} Output voltage high	$I_{OH} = 2\text{ mA}$	0.8 IOV_{DD}			V
V_{OL} Output voltage low	$I_{OL} = -2\text{ mA}$			0.22 IOV_{DD}	V
V_{OH_SCLK} SCLK output voltage high	$I_{OH} = 4\text{ mA}$	2.3			V
V_{OL_SCLK} SCLK output voltage low	$I_{OL} = -2\text{ mA}$			0.6	V

NOTE 1: Measured with a load of 15 pf.

Analog Processing and A/D Converters

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Z_i Input impedance, analog video inputs	By design	500			$k\Omega$
C_i Input capacitance, analog video inputs	By design		10		pF
$V_{i(pp)}$ Input voltage range *	$C_{coupling} = 0.1 \mu F$	0.25		1	V
ΔG Gain control range			12		dB
DNL DC differential non-linearity	A/D only		± 2		LSB
INL DC integral non-linearity	A/D only		± 3		LSB
F_r Frequency response	6 MHz		-0.9	-3	dB
SNR Signal-to-noise ratio	6 MHz, 1.0 Vp-p		50		dB
NS Noise spectrum	50% flat field		50		dB
DP Differential phase			1.5		$^\circ$
DG Differential gain			0.5%		

* The 0.75-V maximum applies to the sync-chroma amplitude, not sync-white. The recommended termination resistors are 37.4Ω .

Timing

Power-On reset Timing

NO.	PARAMETER	MIN	MAX	UNIT
t1	Delay time between power supplies active and reset	20	-	ms
t2	RESETB pulse duration	500	-	ns
t3	Delay time between end of reset to I ² C active	500	-	ns

Clocks, Video Data, Sync timing (27/36MHz)

Data Format : CCIR656 output					
PARAMETER	SYMBOL	MIN	TYP	MAX	UNIT
PIXCLK High pulse duration	t_{hw}	18.5/13.5			ns
PIXCLK Low pulse duration	t_{lw}	18.5/13.5			ns
CCIR656 data out setup time	t_{su}	18.5/13.5			ns
CCIR656 data out hold time	t_h	18.5/13.5			ns

Figure 3-2 . Clocks, CCIR656 Output Data Timing

I²C Host Port Timing

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_1 Bus free time between STOP and START		1.3			μ S
t_2 Setup time for a (repeated) START condition		0.6			μ S
t_3 Hold time (repeated) START condition		0.6			μ S
t_4 Setup time for STOP condition		0.6			μ S
t_5 Data setup time		200			ns
t_6 Data hold time		0		50	ns
t_7 Rise time I2CD and I2CLK signal		250			ns
t_8 Fall time I2CD and I2CLK signal			250		ns
C_b Capacitive load for each bus line				120	pF
f_{I2C} I ² C clock frequency				400	kHz

	Write Address	Read Address
I2CSEL = 0	B8	B9
I2CSEL = 1	BA	BB

NOTES

- DATUM T, U, AND Z TO BE DETERMINED AT DATUM PLANE H.
- DIMENSIONS D AND E TO BE DETERMINED AT SEATING PLANE DATUM Y.
- DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLDDPROTRUSION. ALLOWABLE PROTRUSION IS 0.25 PER SIDE. DIMENSIONS D1 AND E1 DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE DATUM H.
- DIMENSION b DOES NOT INCLUDE DAM BAR PROTRUSION. ALLOWABLE DAM BAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUMb DIMENSION BY MORE THAN 0.08 mm. DAM BAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND AN ADJACENT LEAD IS 0.07 mm.

WARNING

Conditions beyond those listed for the absolute maximum may destroy or damage the products. In addition, conditions for sustained periods at near the limits of the operating ranges will stress and may temporarily (and permanently) affect and damage structure, performance and function.

application circuits illustrated in this document are for reference purposes only.

DAVICOM's terms and conditions printed on the order acknowledgment govern all sales by DAVICOM. DAVICOM will not be bound by any terms inconsistent with these unless DAVICOM agrees otherwise in writing. Acceptance of the buyer's orders shall be based on these terms.

Company Overview

DAVICOM Semiconductor Inc. develops and manufactures integrated circuits for integration into data communication products. Our mission is to design and produce IC products that are the industry's best value for Data, Audio, Video, and Internet/Intranet applications. To achieve this goal, we have built an organization that is able to develop chipsets in response to the evolving technology requirements of our customers while still delivering products that meet their cost requirements.

Products

We offer only products that satisfy high performance requirements and which are compatible with major hardware and software standards. Our currently available and soon to be released products are based on our proprietary designs and deliver high quality, high performance chipsets that comply with modem communication standards and Ethernet networking standards.
